CHUBB®

CHUBB APAC ENGINEERING

Take-Home Assessment

Backend Developer

Time Guidance: 2–3 hours target | Hard cap: 5 hours

Classification: Internal

Background

Chubb APAC processes motor and property claims across six markets. Today the process is fragmented: claimants submit by phone or email and wait with no visibility into what is happening. Claims staff manage incoming work from shared inboxes and spreadsheets, with no consolidated view of their workload. Managers have no real-time picture of outstanding claims or liability exposure.

Your task is to design and build the backend that powers this platform.

Claimants need to be able to report an incident, track their claim, provide additional information when asked, and receive decisions.

Claims staff need to be able to pick up incoming claims, review and assess them, progress claims to settlement or rejection, and see their team's workload and performance.

The frontend is out of scope. What the backend needs to be — its structure, its boundaries, its data model, and how it communicates — is part of the assessment.

Technology

- **Backend:** C#/.NET or Java/Spring Boot — your choice. Both are actively used across Chubb APAC engineering. Choose the stack you are strongest in.
- **Communication:** Our platforms use both REST/HTTP and Kafka. You decide what uses which, and you should be prepared to explain that decision.

No other technology constraints. Database, caching, testing libraries, API tooling — all your decisions.

What to Build

This brief is deliberately underspecified. You decide how to decompose the problem, what the service boundaries are, what the data model looks like, and what to prioritise. The decisions you make — and your ability to explain them — are a significant part of what is being assessed.

Some questions to consider as you decompose the problem:

- What are the core entities in this domain? How do they relate?
- Is this one service or more than one? What drives that decision?
- What operations need to be synchronous? What can be event-driven?
- What is the read/write profile of each concern? Does that affect your design?
- What does a claims officer need to retrieve efficiently to manage their workload?
- How do you handle state transitions in a claims lifecycle? What is the business logic?
- What does the system need to know about outstanding liability exposure?

You will not build everything. Decide what matters most and build that well.

Deliverables

1. Git repository with meaningful commit history showing your development process
2. Working application that can be started locally
3. AI working journal — a running log (committed alongside the code) of what you asked the AI, what you accepted, what you challenged, and what you overrode, with brief reasoning. Does not need to be polished.
4. Any supporting documentation you feel is appropriate
5. 30–60 minute walkthrough with the hiring panel

Walkthrough Format

Segment	Duration
Your presentation — architecture, decisions, demo	15–20 min
Panel Q&A — "why not X?", trade-off deep-dive	10–15 min
What would you do with more time?	10 min
Your questions	5 min

Notes

This is a sprint-format assessment. Target 2–3 hours. Hard cap: 5 hours. We are not expecting a finished product — we are evaluating how much you can build, and how well, when you work with AI effectively.

- This brief is deliberately underspecified. We expect you to decompose the problem, make technology and architecture decisions, and design a solution. Those decisions are part of what we are evaluating.
- Prioritise ruthlessly. Decide what to build and what to leave out, and be prepared to explain that prioritisation in the walkthrough.
- AI is your primary working interface. We expect AI tooling to drive the bulk of code generation. What we are evaluating is how you direct, challenge, and override it. Document your process as you go. You sign off every line you submit — the panel will probe anything you cannot defend.

- The walkthrough is where your thinking is explored. Come prepared to explain the approaches you took and why, the shortcuts you made under time pressure, and what you would do differently or tackle next.

If you have questions about the assessment, contact the hiring panel at [hiring panel contact].

Good luck.
